

CINESTARTMPANEL

CineStarPanelTM Panel Seams

As we use 4' x 8' master sheets for our star ceilings, anything over that size will have multiple panels with seams in the ceiling. We carefully minimize the seams by 2 things, plus lighting also makes them virtually invisible:

- 1) We use Rotofast ceiling fasteners, which self-level the panels to each other, minimizing visible seams.
- 2) We use a very non-reflective matte black acoustically transparent fabric, the FR701 Black product from Guilford of Maine, so light does not reflect the seam locations much.
- 3) Lastly, in most room settings, especially home theaters, there is very little light heading up from the center of the room towards the ceiling, again minimizing the seams in the star panel areas. Most of the light is washing walls with sconces or puck lights shining down from above, so there's little to show seams unless you shine a light up onto the star panels.
