

# CINESTAR<sup>TM</sup>PANEL

## CineStarPanel<sup>TM</sup> Framing and Accent Lighting Options

One framing idea for our star panels is to use a standard small wood molding attached to the ceiling surrounding the Star Panel area to create the illusion of having a **framed skylight to the night sky above**. You can even cover the wood molding with a laminate to simulate virtually any type of material, such as a stainless steel frame look, or even chrome around the perimeter.

We can also pre-install RGB LED accent lighting onto the upper perimeter of the panel area to **bathe the surrounding area in light**, turning your ceiling into a colored light decor element in the room. We provide spacers with an inch clearance from the ceiling. Our Bluetooth controller gives you color selection and dimming capabilities, creating sunset and sunrise effects, plus changing to a myriad of colors, intensity levels and also automatically fading from color to color.

Accent lighting pre-installed on top of the perimeter

Another great idea is to surround the CineStarPanel<sup>TM</sup> ceiling area with a cove, wood molding, or a simple “L” box and we prep our RGB LED strips to install on your own molding underneath the panel area to create an up-lit artificial **cloud horizon effect around the panels**. This can be controlled by various means, including Bluetooth with an Android or Apple app we provide. As the star panels are 1” deep and have ½” spacers, and additional 4” to 5” below this gets the best cloud horizon effect. This is our most popular option and is seen in most of our product photos.

Accent lighting installed on your own molding under the star panel area perimeter
